Problems

- 1º - Inconsistent alignment of buttons and text
  - We think it is well implemented and we do not consider this a problem.
- 2º - Inconsistent alignment of buttons, text and input boxes
  - We think it is well implemented and we do not consider this a problem.
- 3º - The page features too much blue
  - The popup has been changed to white, with blue buttons.
- 4º - Double password confirmation
  - this being a serious error well observed by the group that evaluated the work, the change was made so that there is no error when changing to a new password
- 5º - Inexistent logout button
  - This is a feature that we forgot to implement but will be implemented in the near future.
- 6º - Information about car's temperature and pay rate is not always available
  - This information will be added in the near future so that the user can make more informed and correct decisions
- 7º - Redundancy in button usage
  - This point, despite not being something that breaks the app, is of some importance because although in cars we can choose whether we want hot or cold air regardless of the temperature, it could be more efficient and aesthetic to be all combined in the same button with an option to change between hot and cold air with a change in icon color to distinguish and give feedback to the user about the state of the system. It will be something to change after we implement/change other aspects of the app.
- 8º - Not using saved information
  - This feature will be added in the near future.
